

Kwikbolt | Lightning

Our Lightning design is focused on high load (L6) or low loads (L4) and smaller hole size applications. The fastener uses an expanding leg design to enlarge on the blind side of a structure that pulls back over the body to provide clamping. The Lightning Kwikbolt keeps holes true and provides a low clamp and high shear performance. Head configurations include Flat Protruding (FP), Countersunk Protruding (SP), Countersunk Flush (SF), Countersunk with thread removal (SF-BX) or Countersunk Automated Head (SF-AX)
